

## Fundamentals of Web Design

### CHAPTER 4 – Creating a Simple Page

#### EXERCISE 4-4. Adding a comment and an image

1. Open the document *index.html* in your text editor, if it isn't open already.
2. Make sure the image provided (*blackgoose.png*) is saved in the *bistro* folder before you continue.

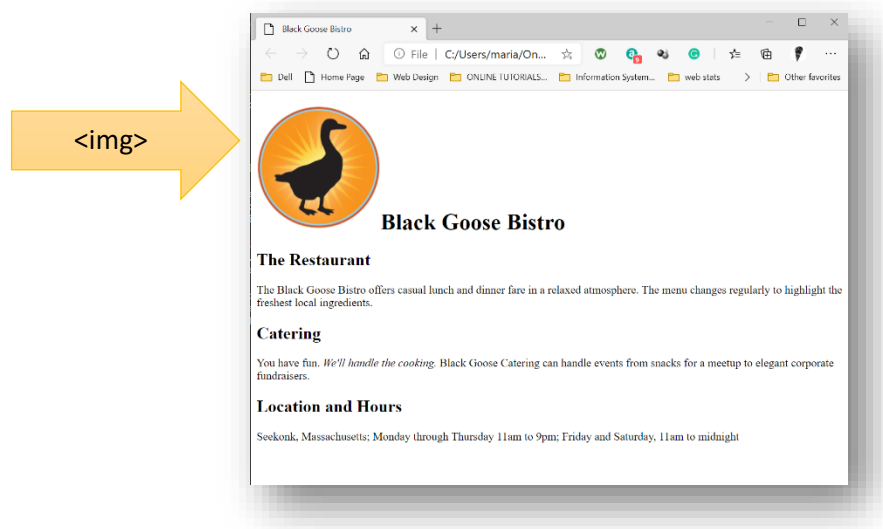

**NOTE:** You will only add the code in blue font color to the existing text.

3. Once you have the image, insert it at the beginning of the first-level heading by typing in the **img** element and its attributes as shown here (remember to **type only the text in blue font color**):

```
<h1>Black Goose Bistro</h1>
```

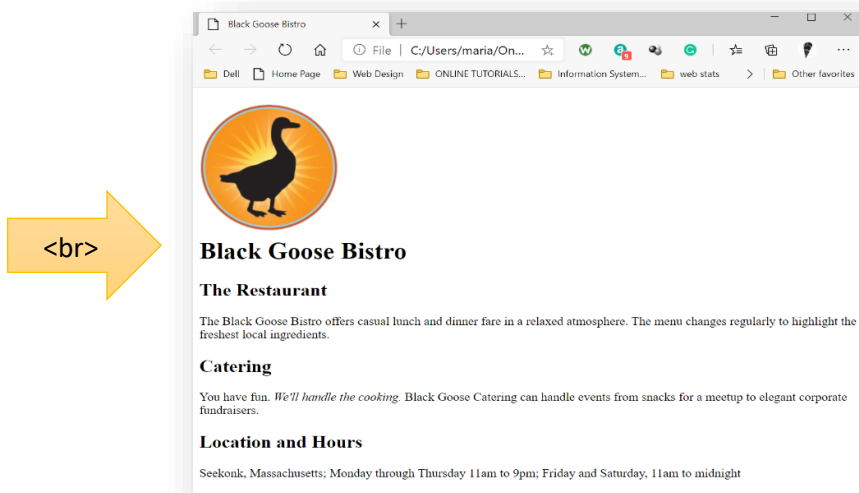

*Note: The **src** attribute provides the name of the image file that should be inserted, and the **alt** attribute provides text that should be displayed if the image is not available. Both of these attributes are required in every **img** element.*

*The **img** tag in an empty element, there is need to use a closing tag*

4. The image appears inline with the text, you will fix that in the next step.
5. The image should appear above the title so add a line break (**br**) after the **img** element to start the headline text on a new line.

```
<h1><br>Black Goose Bistro</h1>
```

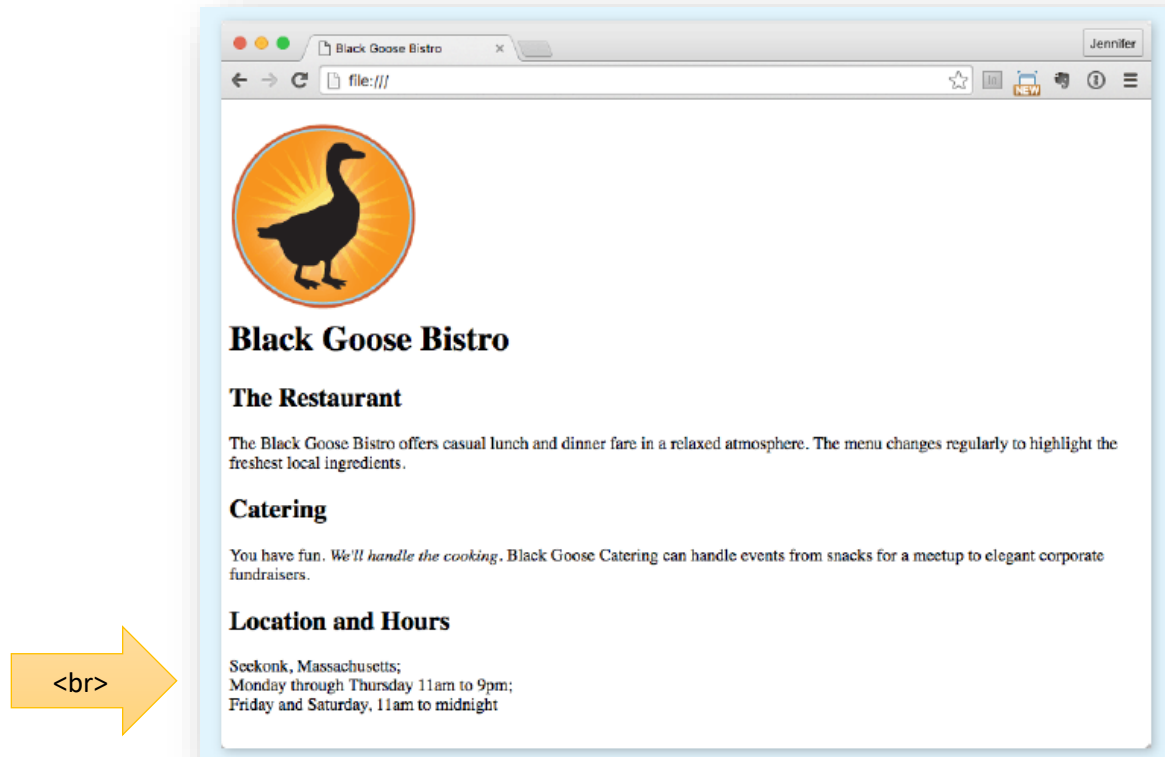

6. Let's break up the last paragraph into three lines for better clarity. Drop a **<br>** tag at the spots you'd like the line breaks to occur.

<p>Seekonk, Massachusetts;<br>

Monday through Thursday 11am to 9pm;<br> Friday and Saturday, 11am to midnight</p>

7. Now save **index.html** and open or refresh it in the browser window. The page should look like the one shown below.

8. If it doesn't, check to make sure that the image file, *blackgoose.png*, is in the same directory as *index.html*. If it is, then check to make sure that you aren't missing any characters, such as a closing quote or bracket, in the **img** element markup.

9. Go back to the text editor and type the following *comment* (write your name and last name after the phrase *Prepared by* ) in a blank line between the **<body>** element and the **<h1>** element (remember, only type the **text in blue**):

<body>

<!--Prepared by YourName LastName -->

<h1><br>Black Goose Bistro</h1>

10. Save again and refresh the browser. The comment is invisible in the window browser, remember. Keep the file open if you plan to complete the last exercise from chapter 4.
